ABOUT THE TRAINING

Egg is one of the most important and cheapest source of animal proteins and other nutrients as well as considered as complete food. The biological value of egg proteins is considered as 97% and is also used as reference standard for other proteins. Even the egg has been included under the Mid-Day Meal Program, a flagship program of Government of India for the alleviation of malnutrition among children. Out of the total egg produced in India, 82.2% is from the organized sector while the 17.8% is from the unorganized sector. Although India has shown a very large leap in the egg production during last decade, being such a large country and availability of resources there is vast capacity to further increase the production & export. However, hygienic production of egg and maintenance of egg quality during storage and distribution is a constant and major challenge. Although the egg industry is an organized one, the sudden onset of diseases poses a major hurdle for the hygienic production, distribution and storage of egg of which the egg industry is unaware. Therefore, the present training on “**Hygienic Egg Production**” is organized to create awareness on these aspects among different stakeholders such as industry personnel, students, academicians, rural poultry farmers etc.
